

Cinematic

Your personal movie & TV show companion — discover, rate, and track everything you watch.

Cinematic is a Flutter-based mobile application inspired by IMDb. It allows users to explore movies and TV shows, view detailed information, browse ratings, and manage their personal watchlist — all wrapped in a sleek, cinematic UI.

Features

-  Search for movies and TV shows
 -  View detailed info — synopsis, cast, genre, release date, and ratings
 -  Browse top-rated and trending titles
 -  Add titles to your personal watchlist
 -  Firebase integration for backend & authentication
 -  Cross-platform — runs on Android, iOS, and Web
-

Tech Stack

Technology	Purpose
Flutter	Cross-platform UI framework
Dart	Programming language
Firebase	Backend, authentication & database

How to Run

Prerequisites

Make sure you have the following installed on your machine:

- [Flutter SDK](#) (version 3.x or higher recommended)
- [Dart SDK](#) (comes with Flutter)
- [Android Studio](#) or [VS Code](#) with Flutter extension

- An Android emulator, iOS simulator, or a physical device

Steps

1. Clone the repository

bash

```
git clone https://github.com/your-username/cinematic.git  
cd cinematic
```

2. Install dependencies

bash

```
flutter pub get
```

3. Run the app

bash

```
flutter run
```

If you have multiple devices connected, Flutter will ask you to choose one.

Build for a specific platform

bash

```
# Android  
flutter build apk  
  
# iOS  
flutter build ios  
  
# Web  
flutter build web
```

Project Structure

```
cinematic/
```

```
└─ lib/           # Main Dart source code
└─ assets/        # Images, fonts, and static files
└─ android/       # Android platform files
└─ ios/           # iOS platform files
└─ web/           # Web platform files
└─ firebase       # Firebase configuration
└─ pubspec.yaml   # Dependencies & project config
```

⚙️ **Firebase Setup**

This project uses Firebase. If you're setting it up from scratch:

1. Go to [Firebase Console](#)
2. Create a new project
3. Add your Android/iOS app and download the `google-services.json` / `GoogleService-Info.plist`
4. Place the config files in the appropriate platform folders
5. Run `flutter pub get` again

┆ If you're just cloning and running the existing project, Firebase is already configured.
